Image Editing in Photoshop When you work with raster images, such as those that you create using a scanner, camera, or computer, you do not manipulate individual pixels. You manipulate areas of color called _raster_ or _pixel_ objects. _Bitmap_ is a term used to refer to the individual pixels in raster images that may or may not have a _color model,_ or a color organization, when they are displayed. Photoshop's job is to create these pixel objects. It does this by manipulating color and attributes such as brightness and contrast. Once you start working with Photoshop, you won't know how to work without it! * * * # Easier with shortcuts Photoshop has many editing tools that you can access quickly with keyboard shortcuts. For example, if you find it quicker to work with the Move tool, you can use the keyboard shortcut +M for its command. You can also quickly create a new layer by pressing +Shift+N, or +Ctrl+N. I refer you to Chapter 1 for more information on keyboard shortcuts. * * * * **Arrow keys**. Pushing the keyboard's Arrow keys allows you to move a selected object around in the image. In the Layers panel, you have the ability to change the object's position within that layer (if it isn't already selected), and it can appear on a separate layer. You can also use the Layer menu to make a selection of the entire image and move it if necessary. This method is described in Chapter 1. * * * # Bracketing with layers The Layer panel allows you to do a lot more than simply drag and drop elements between different layers. In fact, layers can be any combination of things that the program can create in the image. You can manipulate a layer to completely erase or replace any part of the original image. * * * # Rewriting history History allows you to undo and redo any number of editing steps or actions. In the toolbox, a rectangle appears when you press (the first key). Elements from the last time you used that particular tool appear here. You can click the redo icon to undo your edits or the delete icon to delete the action or adjustment. Or you can simply press the Escape key to undo the command from the last time you used it. * * *

Photoshop is a great tool to build a portfolio, but it might not be suitable for everyone. Why are we mentioning it in a tutorial about Adobe XD? Because it is powerful tool for designing, and has an extensive set of features. Adobe XD is a leading designer for vector graphics, SVG, web, mobile and more. Today we'll be discussing some of the most useful Photoshop tools to design web graphics. But before we start, let's check out the most used Photoshop tools. Check these tools: Good news, you can use these tools in Adobe XD as well. Screen recording When you need to show some of the changes to a file, or when you need to teach someone how to edit a graphic, the best tool is screen recording. Luckily, Adobe has the Clip Studio for Mac, a screen recorder, which is easy to record. Check out the quick example below. You can record 1 to 5 minutes, and if you're short on time, you can stop the recording at any point and start again. Then, download the clip and bring it to the next step. Photoshop buttons panel You can find various actions in the main Photoshop toolbar (press 'J'), but the Photoshop buttons panel (press 'K') allows you to do things that the main toolbar doesn't offer. Let's explore what those panels are and why you should add them to your toolbox. Add an action If you want to perform a task, press 'A' and choose the one that is closest to the file type you're editing. You can choose any of the tools, rotate the image, crop it, resize it, straighten it, and many more. The list of actions you can do with the buttons panel is endless. For web design and illustration, we

recommend you add these actions: Border Background removal Transform Drop shadow Gradient Navigation Grid Link The buttons panel provides access to a lot of its actions. You can access any of the actions in the buttons panel by just pressing 'K.' If you have any questions about using these actions, we invite you to contact our support team via live chat or in one of the mentioned ways: Add a 05a79cecff

In a plurality of video coding technologies, coding is performed by dividing a frame into blocks of a predetermined size and performing coding on each block. In the H.264 coding technology, intra prediction (prediction from a frame neighboring a block in a current frame) is performed on a current block. In addition, in H.264, an intra prediction mode can switch based on a flag value (a prediction direction flag value) indicating the direction of prediction (intra prediction). FIG. 12 illustrates a method of switching based on the prediction direction flag value in H.264. As illustrated in FIG. 12, in the case of switching between intra 4×4 and intra 16×16 modes, if the prediction direction flag value is 0, then intra 4×4 mode is selected. In the intra 16×16 mode, intra prediction in the vertical direction is switched to intra 4×4 prediction based on the prediction direction flag value. If the prediction direction flag value is 1, then intra 4×4 mode is selected for both vertical and horizontal directions. In this case, there is no need to switch prediction directions in both vertical and horizontal directions, and thus a number of switching operations is reduced. FIG. 13 illustrates a diagram of the intra prediction in a case where the prediction direction flag value is 0. As illustrated in FIG. 13, intra prediction is performed using a left prediction column and a top prediction column of a reference image of an intra 4×4 block on a left side of a current block. However, in the case where the prediction direction flag value is set to 1, as described above, horizontal and vertical prediction directions do not change between adjacent blocks, and thus there is a need for a coding apparatus to predict based on an equivalent intra prediction mode on a current block, to thereby reduce the number of prediction direction switching operations. Therefore, in H.264, intra prediction direction can switch in accordance with a prediction direction flag value, and a mode used when the prediction direction flag value is 1 is defined as an equivalent intra prediction mode (hereinafter referred to as an "equivalent intra prediction mode with no prediction direction flag value"). FIG. 14 illustrates a method of switching the prediction direction flag value. As illustrated in FIG. 14, a prediction direction flag value is set to 1 at positions where a block is predicted based on the equivalent intra prediction mode. Accordingly, a prediction direction flag value is set to 0 in a region other than the positions where a block
